NOISE LAB TEST REPORT Number A-2023LAB-005-1-45008_E

Customer :	Concordia Textiles Flanders-Fieldweg 37 8790 Waregem Belgium	
Contacts :	Client : Noise lab :	Rik Gekiere Els Meulemans
Tests : Product name :		d absorption in the reverberation room ype E-300 mounting (air cavity 280 mm)
Normative references: NBN EN ISO 354:2003		ment of sound absorption in a reverberation room
NBN EN ISO 11654:1997 NBN ISO 9613-1:1996 ISO 12999-2:2020	Acoustics - Attenuatio part 1 : Calculation of	sorbers for use in buildings - Rating of sound absorption n of sound during propagation outdoors - the absorption of sound by the atmosphere tion and application of measurement uncertainties in building acoustics ion

To perform the above measurements, the laboratory of Daidalos Peutz is accredited by BELAC, "The Belgian Accreditation Body", under the certificate nr N°451-TEST. The activities covered by this accreditation certificate are covered by the EA MLA. BELAC is a signatory of all existing multilateral agreements and recognition agreements of International Laboratory Accreditation Cooperation (ILAC). In this way, reports issued by BELAC accredited bodies are internationally accredited.

	Date of receipt of the specimen(s): 23/03/2023 1 Date of construction: 23/03/2023 1 Date of tests: 23/03/2023 1
--	---

The measurements were carried out at Daidalos Peutz Laboratory for Acoustics at Hooglede, see appendix 1 This test report together with its annexes contains : 9 pages and must be multiplied only in its entirety

NOISE LAB TEST REPORT Number A-2023LAB-005-1-45008 E

TEST METHOD

The tests were conducted in accordance with the provisions of the test method EN ISO354:2003. A detailed description of the test set up has been given in the figures of annex 1 of this report.

The measurement method can be simply descibed as follows:

Essence of the test is in measuring of the reverberation time in the empty reflecting room and in the same room with the test sample inside it. The sound-absorption properties of a material depend on how the material is mounted during the test. Annex B of ISO 354:2003 specifies several different standard mountings that shall be used during a test for sound absorption. Normally a test specimen is tested using only one of the specified mountings.

From these reverberation times, the equivalent sound absorption area of the test specimen, is calculated by using Sabine's equation. Measurement is carried out in ranges of 1/3 octave and interval from 100Hz to 5000Hz.

The equivalent sound absorption area of the empty reverberation room, A1, in square metres, shall be calculated using the formula (1):

 $A_1 = 55,3 V / (c_1 T_1) - 4Vm_1$ [m²] (1)

The equivalent sound absorption area of the reverberation room containing a test specimen, A2, in square metres, shall be calculated using the formula (2) :

[m²] (2)

[m²] (3)

 $A_2 = 55,3 V / (c_2 T_2) - 4Vm_2$

The equivalent sound absorption area of the test specimen, AT, in square metres, shall be calculated using the formula (3) : $A_T = A_2 - A_1 = 55,3 V (1/c_2T_2 - 1/c_1T_1) - 4V(m_2 - m_1)$

The sound absorption coefficient of a plane absorber or a specified array of test objects shall be calculated using the formula (4):

	α	_s = A _T / 3	S	(4)
whereas:	A ₁		=	The equivalent sound absorption area of the empty reverberation room in square metres
	A ₂		=	The equivalent sound absorption area of the reverberation room containing a test specimen in square metres
	V	=		volume , in cubic metres, of the empty reverberation room [m ³]
	c ₁ ,c ₂	=		the propagation speed of sound in air, in [m/s], calculated using the formula
				(in function of the temperature in the room during the test)
				c=331 + 0,6 t with t= the air temperature in degrees Celsius
				for temperatures in the range of 15°C to 30°C
	T ₁		=	the reverberation time, in seconds, of the empty reverberation room
	T ₂		=	the reverberation time, in seconds, of the reverberation room after the test specimen has been introduced
	m1,m2		=	the power attenuation coefficient, in reciprocal metres, calculated according to ISO 9613-1:1993
	A _T		=	The equivalent sound absorption area of the test specimen in square metres
	S		=	the area, in square metres, covered by the test specimen
	α_{s}		=	the sound absorption coefficient

SPECIAL MEASUREMENT CONDITIONS

daidalos peutz

NOISE LAB TEST REPORT Number A-2023LAB-005-1-45008_E

RATING OF SOUND ABSORPTION

α_{D} PRACTICAL SOUND ABSORPTION COEFFICIENT

Frequency-dependent value of the sound absorption coefficient which is based on measurements on one-third-octave bands in accordance with ISO 354 and which is calculated in octave bands in accordance with the standard ISO 11654:1997. The practical sound absorption coefficient, api, for each octave band i, is calculated from the arithmetic mean value of the three one-third octave sound absorption coefficients within the octave. The mean value is calculated to the second decimal and rounded in steps of 0,05 and maximized to 1,00 for rounded mean values > 1,00

α_w WEIGHTED SOUND ABSORPTION COEFFICIENT

The weighted sound absorption coefficient is determined as a single number value from the practical sound absorption coefficients from 250 Hz to 4000 Hz. The practical sound absorption coefficient is calculated according to ISO 11654:1997. Single-number frequency-independent value which equals the value of the reference curve at 500 Hz after shifting is as specified in the standard ISO 11654:1997.

SHAPE INDICATORS, L,M,H

Whenever a practical sound absorption coefficient api exceeds the value of the shifted reference curve by 0,25 or more, one or more shape indicators shall be added, in parantheses, to the aw value.

If the excess absorption occurs at 250 Hz, use the notation L.

If the excess absorption occurs at 500 Hz or 1000 Hz, use the notation M.

If the excess absorption occurs at 2000 Hz or 4000 Hz, use the notation H.

NRC NOISE REDUCTION COEFFICIENT

The NRC is a single-number index determined in a lab test and used for rating how absorptive a particular material is. This industry standard ranges from zero (perfectly reflective) to 1 (perfectly absorptive). It is simply the average of the mid-frequency sound absorption coefficients (250, 500, 1000 and 2000 Hertz) rounded to the nearest 5%.

SAA SOUND ABSORPTION AVERAGE

NRC is being replaced by the Sound Absorption Average (SAA), which is described in the current ASTM C423-17. The SAA is a single-number rating of sound absorption properties of a material similar to NRC, except that the sound absorption values employed in the averaging are taken at the twelve one-third octave bands from 200 Hz to 2500 Hz, inclusive, and rounding is to the nearest multiple of 0.01.

The NRC and SAA results are not within the scope of the accreditation.

Test results related to tested object only. The test results should not be considered as material constants, the absorption depends not only on the material itself. The method of construction, the size of the material surface and its place in the room, affect the sound absorption characteristics of the test element.

ACCURACY

The accuracy of the absorption coefficients as calculated can be expressed in terms of repeatability of measured reverberation times (tests within one laboratory) and reproducibility (between various laboratories)

met

The expanded uncertainty under reproducibility conditions, U, is calculated in accordance to the standard ISO 12999-2 for the confidence level of 95%, used the coverage factor k=2

u = uncertainty under reproducibility conditions

k = coverage factor (k=2 for a confidence level of 95%)

U = expanded uncertainty under reproducibility conditions

This standard specifies how to calculate :

- the uncertainty of sound absoption coefficients and equivalent sound absorption areas measured according to ISO 354

- the uncertainty of the practical and weighted sound absorption coefficients determined according to ISO 11654

The numbers given are derived form inter-laboratory measurements with different types of test specimens including suspended ceilings, mineral wool, foams

ANNEX 3: photographs of the test element or the test arrangement

Description of the assembly or drawing or photo

The test object was installed as a type E mounting specified in Annex B of ISO 354:2003.

First, 5 main runners with a length of ±3.6 m were installed and attached to the perimeter of the test sample.

Then the cross-tees were inserted, to form a grid.

The ceiling tiles (600 mm x 600 mm) were laid in the grid. To improve retention of the tiles, Rockfon Hold Down Clips were used.

The test sample was sealed along its entire perimeter with an acoustically reflective frame (2 x 18 mm MDF),

with a surface density of at least 20 kg/m², as described in ISO 354:2003.

The exposed surface of the MDF frame was flush with the exposed surface of the test sample (ceiling tiles).

The perimeter frame was sealed at the bottom (frame/concrete floor) as well as at the top (frame/test specimen) with a non-sound absorbing tape.

The length:width ratio of the test sample is 1:0.83. The defined area of the test sample exposed to sound = 10.56 m².
